Preparations

TEST ENVIRONMENT

DOMAIN=openapi-cn-test.xiaoyi.com/

PROD ENVIRONMENT

DOMAIN=open-gw.xiaoyi.com/

Obtain your APPID and SecretKey.

Example:

AppID	SecretKey
Bib82JkvvvtC4eCUuI2 d7zzzSBfAFpCcW3	9zUEzIUS4rIXIC2kCtZvEVQZKYYRY2Zr

Signing Process

Generating KeyTime

1. Get the Unix timestamp(second) "StartTimestamp" corresponding to the current time.
2. Calculate the Unix timestamp "EndTimestamp" corresponding to the signature expiry time based on the timestamp above and the expected validity period of the signature.
3. Splice the signature validity period in the format of StartTimestamp;EndTimestamp.

Example:

keyTime=1581782400;1581786000

Generating SignKey

Calculate the message digest (hash value) using HMAC-SHA1 with SecretKey as the key and KeyTime as the message, which is SignKey.

Pseudocode:

SignKey=HMAC-SHA1(SecretKey, KeyTime)

Generating HttpParametersString

1. Traverse the HTTP request parameters, generate the key-to-value mapping "Map" and the key list "KeyList", where key is converted to lowercase and value is UriEncoded.
2. Sort the KeyList in lexicographical order.
3. UriEncode the keys in the Map and KeyList and convert them to lowercase too.
4. Splice all key-value pairs in the Map in the order of the KeyList in the format of key1=value1&key2=value2&key3=value3, which is the HttpParametersString.

Generating Signature

Calculate the message digest using HMAC-SHA1 with **SignKey** as the key and [**HttpParametersString**] as the message, which is the Signature.

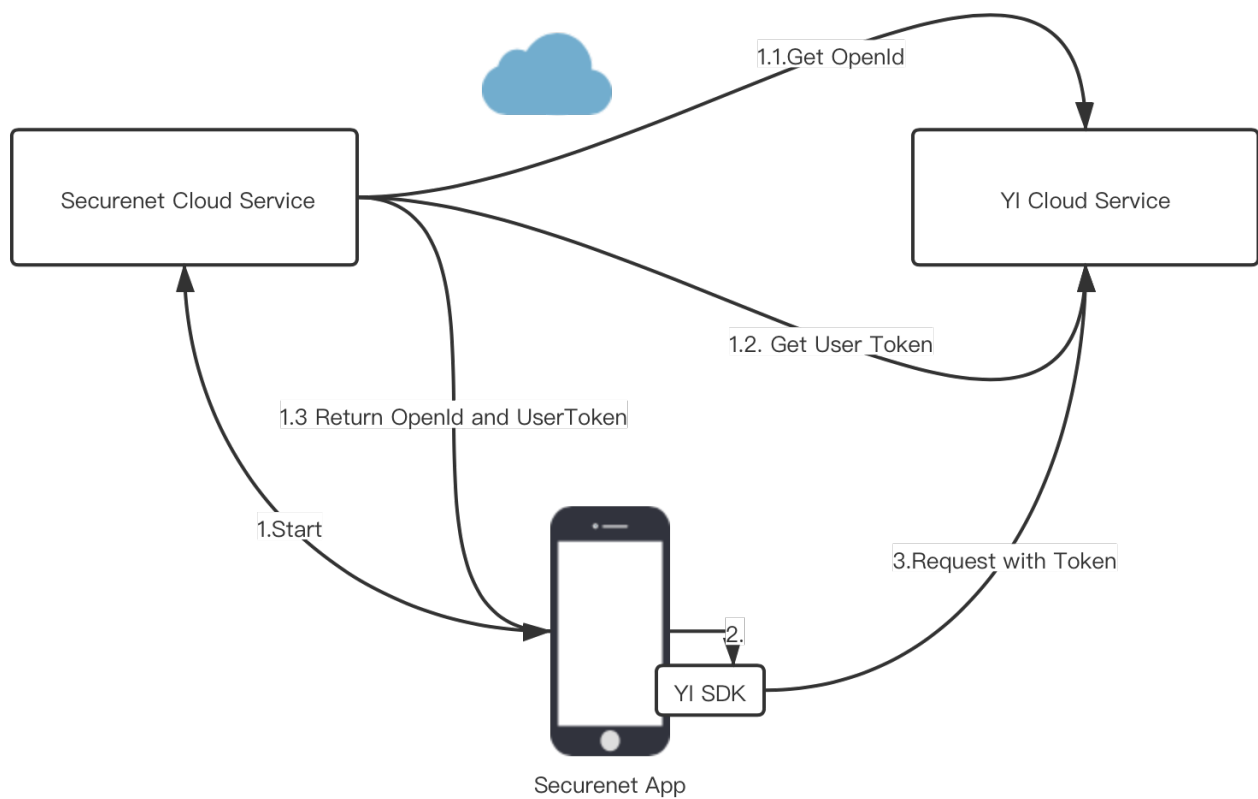

- **HttpParametersString**Need to exclude keytime and sign.

Signature Use

Pass as an HTTP request parameter (be sure to UriEncode), such as https://openapi-cn-test.xiaoyi.com/user_token?appld=12345678&keyTime=1581782400;1581786000&sign=xxxxxx&client_token=xxxxx
